Protecting and improving the nation's health

# Laboratory confirmed cases of pertussis in England: annual report for 2017 supplementary data tables

# About Public Health England

Public Health England exists to protect and improve the nation's health and wellbeing, and reduce health inequalities. We do this through world-leading science, knowledge and intelligence, advocacy, partnerships and the delivery of specialist public health services. We are an executive agency of the Department of Health and Social Care, and a distinct delivery organisation with operational autonomy. We provide government, local government, the NHS, Parliament, industry and the public with evidence-based professional, scientific and delivery expertise and support.

# Laboratory confirmed cases of pertussis in England: annual report for 2017 supplementary data tables

Laboratory confirmed cases of pertussis reported to the enhanced surveillance programme in England: annual report for 2017:

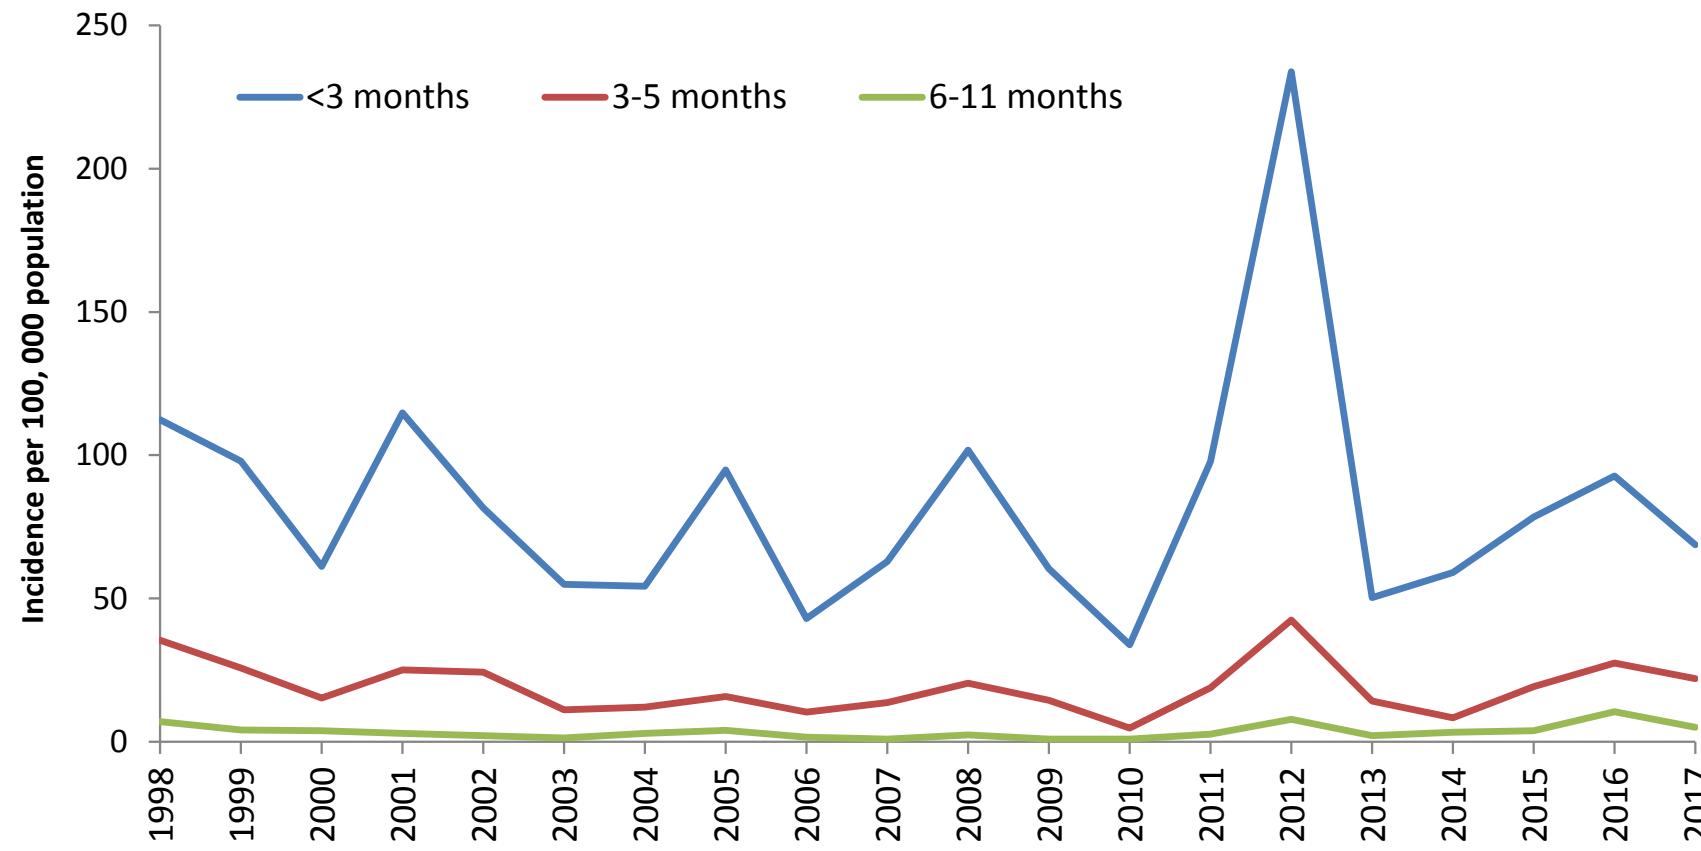

<https://www.gov.uk/government/publications/pertussis-laboratory-confirmed-cases-reported-in-england-2017>

Figure 1: Laboratory confirmed cases of pertussis infection by year and quarter, England: 2008 to 2017\*

\*2017 are provisional data.

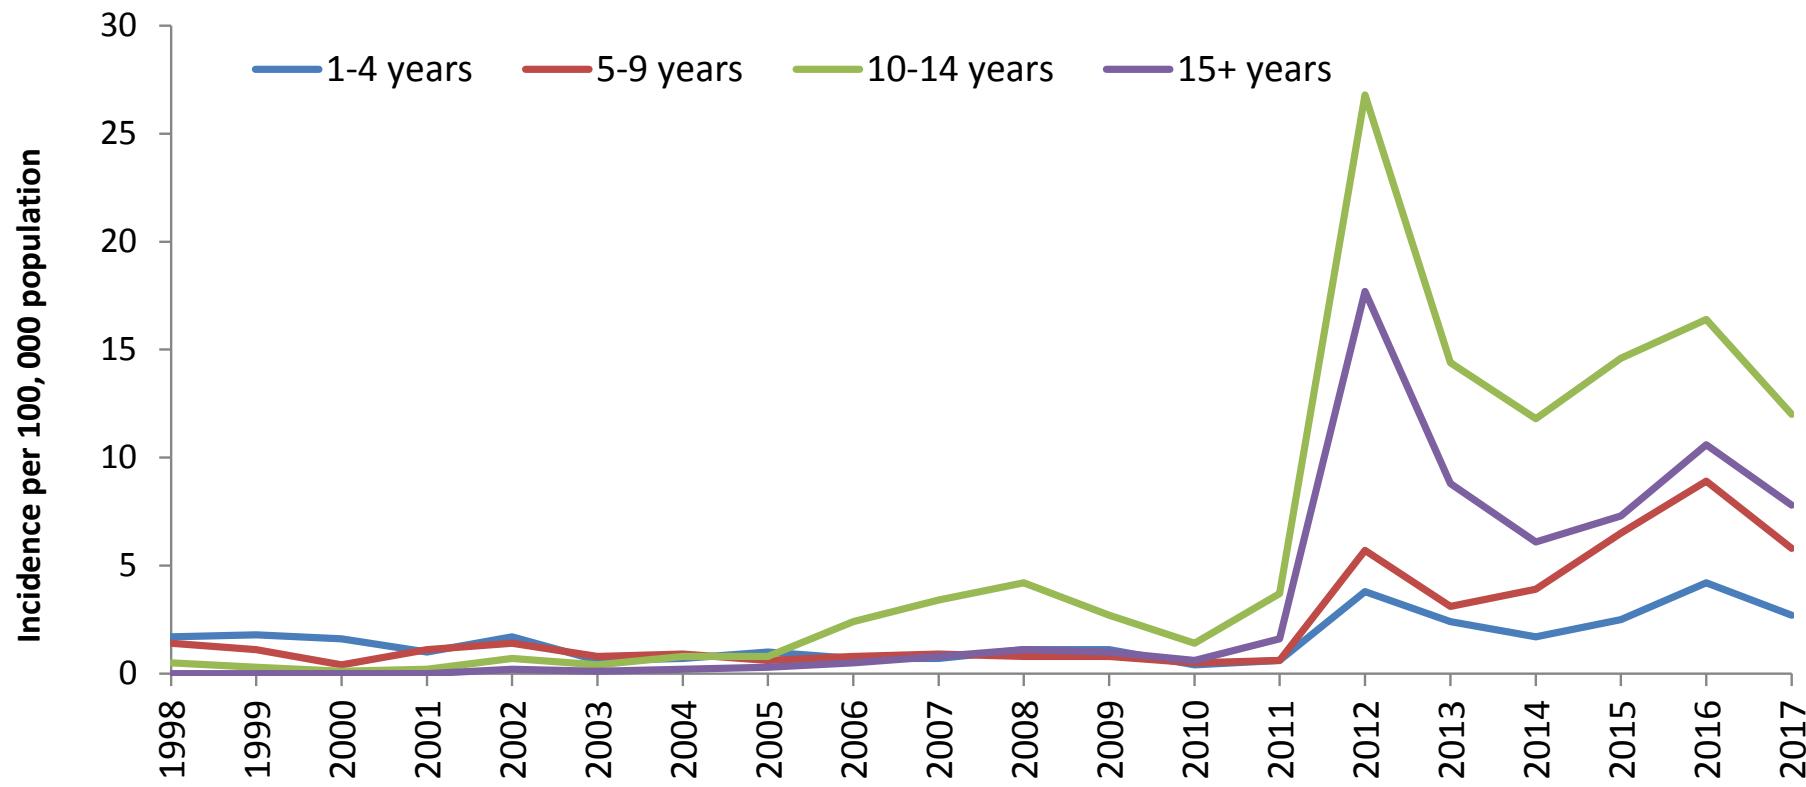

Figure 2a: Incidence of laboratory confirmed pertussis cases, aged < 1 year, England: 1998-2017\*~

\*2017 are provisional data.

~More diagnostic methods have become available over the time period presented with increasing use of serology in particular from around 2006 (see Table 4 and Figure 3) and oral fluid testing introduced from 2013 for those aged 5-16 years.

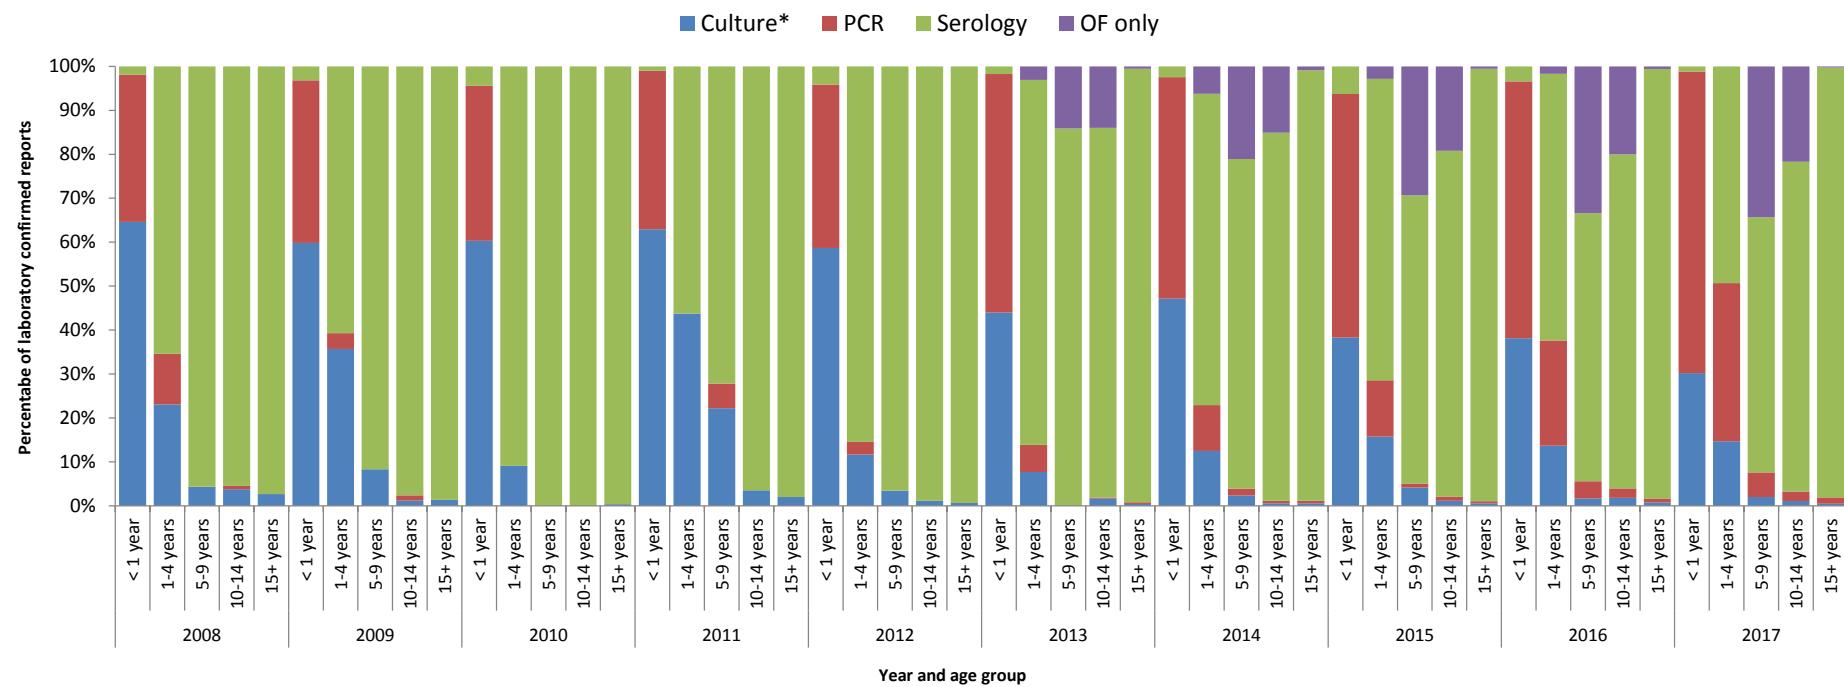

Figure 2b: Incidence of laboratory confirmed pertussis cases, aged 1 year and older, England: 1998-2017\*~

\*2017 are provisional data.

~More diagnostic methods have become available over the time period presented with increasing use of serology in particular from around 2006 (see Table 4 and Figure 3) and oral fluid testing introduced from 2013 for those aged 5-16 years.

**Figure 3: Proportionate distribution of laboratory confirmed pertussis cases by laboratory method shown by year and age group, England 2008-2017\*~**

\*2017 are provisional data.

~Culture confirmed cases may additionally have tested positive by any other method, PCR confirmed cases may have additionally tested positive by serology or OF and serology confirmed cases may also have been confirmed by OF. Cases are only represented once on the graph.

#Culture confirmed cases may additionally have tested positive by any other method, PCR confirmed cases may have additionally tested positive by serology or OF and serology confirmed cases may also have been confirmed by OF. Cases are only represented once in the table.

\*2017 are provisional data.

∞The totals include a very small number of cases where the age was not known.

~More diagnostic methods have become available over the time period presented with increasing use of serology in particular from around 2006 (see Figure 3) and oral fluid testing introduced from 2013 for those aged 5-16 years.

**Table 5: Pertussis notifications and deaths, England: 2001 – 2017\***

Year	Notifications	Deaths <sup>∞</sup>
2001	851	6
2002 <sup>#</sup>	858	2
2003	386	0
2004 <sup>#</sup>	475	4
2005	567	6
2006	539	4
2007	1,070	4
2008	1,465	6
2009	1,126	2
2010	382	1
2011	811	5
2012	6,223	14
2013 <sup>#</sup>	2,967	3
2014	2,302	7
2015	2,680	4
2016 <sup>#</sup>	4,134	4
2017*	3,027	0

∞ From 2001 death data includes deaths from all sources linked to a laboratory-confirmed case of pertussis aged less than 1 year.

# Where a case was confirmed in one year but died the following year this is recorded as a death in the year it was confirmed. This ensures consistency between data presented on laboratory confirmed cases of pertussis and related deaths.

\* 2017 data are provisional data.

**Table 6: Historic pertussis notifications and deaths, England and Wales:**

**1940 - 2000**

Year	Notifications	Deaths~
1940	53,607	678
